

Define Problem Statements

FitBuddy AI Fitness Plan Generator

A focused problem definition for the first FitBuddy release.

Project context

The supplied project guide and README describe a local web app that collects a fitness profile, creates a seven-day plan and tip, saves the result, and accepts feedback. The problem definition below follows that documented workflow.

Problem statement

People who want to exercise may have a goal but lack a clear weekly routine that reflects their experience, preferred effort and available equipment. They also need a simple way to review the plan, request a practical change and find the saved version later.

User and project needs

Need	FitBuddy response
A clear starting point	A short profile form collects the context used to shape the week.
A manageable routine	A seven-day plan presents daily activity and recovery in one result.
A way to adapt	A feedback form asks for a change to the most recent plan.
Continuity	SQLite links user profiles to saved plans and revisions.
Confidence and safety	The interface explains the general-information boundary and the selected AI mode.

Scope statement

FitBuddy supports general fitness planning and local plan management. It does not diagnose conditions, prescribe treatment, calculate a medical target or replace qualified professional advice.
