

Empathy Map and Idea Prioritization

FitBuddy AI Fitness Plan Generator

A provisional empathy map and a prioritized first release.

Empathy map

These are design hypotheses inferred from the documented form and feedback flow, not findings from interviews. Validate them with real users before treating them as research conclusions.

Perspective	Working hypothesis
Thinks	I know what I want to improve, but I am unsure how to organize the week.
Feels	I want to make progress without being pushed into a pace that does not fit me.
Needs	A plan that matches my experience, equipment and selected intensity, with visible recovery.
Does	Reviews the generated plan, then tries a change such as easier sessions or lower-impact movement.

Idea prioritization

Order	Idea	Reason
1	Generate and save a weekly plan	Delivers the primary user outcome and creates a result the user can revisit.
2	Revise from feedback	Makes the plan responsive to a user's stated preference.
3	Show a nutrition or recovery tip	Adds brief supporting guidance without expanding into diet treatment.
4	Offer local demo mode and API docs	Makes the workflow easier to present and inspect without relying on live generation.

Questions for future user research

- Can users understand the profile fields and choose an intensity confidently?
- Does the seven-day result make recovery and the next action clear?
- Do users trust the feedback revision and understand what was changed?
- Which wording or accessibility changes would improve the small-screen experience?
