

Phase 1 Brainstorming and Ideation

FitBuddy AI Fitness Plan Generator

This phase defines the problem and prioritizes FitBuddy's first useful release. The product direction is a local, goal-based fitness assistant that turns a few profile details into an understandable seven-day routine and lets the user request an adjustment. The initial scope favors clear, safe general guidance over clinical features.

Problem and opportunity

People starting or maintaining exercise may need help turning a broad goal into a weekly routine they can understand and adapt. FitBuddy addresses that need by collecting a few relevant preferences, organizing a week of activity and recovery, and presenting the result in a simple web interface.

Intended users and needs

- Beginners who want a practical starting routine and clear exercise instructions.
- People exercising at home or in a gym who need suggestions that reflect available equipment.
- Users who want to adjust a saved plan after seeing its first version.
- Project demonstrators who need a local application that can run with sample data and without a live AI key when demo mode is available.

Ideas and priority

Capability	User value	Priority
Personalized weekly workout	Turns a stated goal, experience, intensity and equipment into a structured seven-day plan.	Core
Feedback-based revision	Lets the user request a practical change and view the revised plan.	Core
Saved profile and plan	Supports retrieving a plan after generation and associating feedback with it.	Core
Nutrition or recovery tip	Adds one concise, general wellness suggestion alongside the workout.	Supporting
Local demo and admin views	Supports evaluation, troubleshooting and presentation without public hosting.	Supporting

Product principles

- Personalize only from information the user supplies; do not infer medical history or promise results.
- Build recovery into the week and offer equipment-aware options.
- Explain that fitness and nutrition content is general information, not medical advice.
- Keep the first release small enough to run locally and easy to demonstrate.

Phase outcome

The selected concept is a local fitness-plan generator with saved plans, a general nutrition or recovery tip, and a feedback loop. Phase 2 turns this direction into testable functional and quality requirements.
