

Problem Solution Fit

FitBuddy AI Fitness Plan Generator

How FitBuddy's first release maps to the documented user problem.

Fit hypothesis

If a user provides a goal, fitness context and preferred intensity, then a readable seven-day plan with recovery and a simple feedback route can make the next workout easier to choose and adjust.

Need-to-feature alignment

User need	Product feature	Fit rationale
Turn a broad goal into action	Seven-day plan	Organizes the week into specific daily activities.
Use equipment that is available	Profile and plan generation	The user supplies context that the plan can reflect.
Adjust after review	Feedback revision	The user can request an easier, shorter or lower-impact change.
Keep a plan for later	SQLite history	Profiles and plans are saved for retrieval.
Avoid confusion about AI	Mode indicator and demo path	The result identifies whether it came from Gemini or demo generation.

Evidence and open questions

The supplied guide documents the interface, local data flow and example screens. It does not provide user-research results or a measured outcome study. The product fit should therefore be treated as a design hypothesis until tested with representative users.

Measure fit in a pilot

- Ask users to complete the profile-to-plan flow without coaching.
- Record whether they can explain the seven-day structure and locate recovery guidance.
- Observe whether they can request and recognize a revision.
- Collect feedback on clarity, trust, accessibility and perceived usefulness; do not collect unnecessary health details.
