

Risk and Dependency Plan

FitBuddy AI Fitness Plan Generator

Practical mitigations for the supplied project's key risks.

Risk register

Risk	Why it matters	Mitigation
Credential exposure	Both .env and .env.example have configured values; the guide flags a non-empty Gemini key in the example file.	Do not put values in phase PDFs or archives. Replace the example key with a placeholder and rotate the exposed key before sharing.
Admin token in URL	URLs can be retained in browser history, logs or screenshots.	Keep the app local; for hosted use, move to proper authentication and avoid secrets in query strings.
Private database records	fitbuddy.db contains saved user and plan data.	Do not include the raw database in this document package; anonymize or clear records before sharing a project copy.
AI service unavailable	A missing key, provider error or unavailable model may interrupt live generation.	Use the configured deterministic demo path for presentations and show the mode label.
Unsafe or unclear plan	Generated fitness content may not fit every user's needs.	Review outputs, keep safety language, include recovery and avoid medical claims.

Delivery dependencies

- Local Python environment and dependencies are installed.
- Configuration selects a supported model or allows demo generation.
- SQLite can create and update the required tables.
- Screenshots, logs and shared documents contain no secrets or real user records.

Escalation boundary

A public deployment is a separate project decision. Before hosting, add production authentication, HTTPS, secret management, request limits, privacy and retention controls, monitoring and a managed database.
