

Performance and Quality Test Plan

FitBuddy AI Fitness Plan Generator

A repeatable plan to assess responsiveness, reliability and safety.

Performance checks

Check	Method	Evidence
Page load	Measure home, result and coach-page response time in the local environment.	Observed time, browser and machine.
Demo generation	Time plan generation with the deterministic local path over repeated runs.	Median and range from repeated samples.
Gemini generation	Measure separately from demo mode after confirming provider access.	Response time, model label and any provider error.
Database growth	Generate and revise multiple fictional plans, then retrieve history.	No missing records or unexpected query slowdown at the pilot scale.
Narrow-screen layout	Review profile and result pages at a mobile viewport.	Readable fields, no horizontal overflow and usable buttons.

Quality and safety review

- Confirm the week is complete and recovery guidance is visible.
- Check that equipment, goal and intensity labels match the submitted profile.
- Review generated content for unsafe exercise instructions, medical claims or inconsistent revisions.
- Verify that provider errors are understandable and that demo/live mode is not misrepresented.

Privacy and security review

Check that .env and *.db remain excluded from shared archives. Remove admin tokens and personal profile values from URLs, screenshots and logs. Do not use the local token-in-query design on a public deployment.

Reporting rule

Set acceptable response-time targets before measuring. Record the environment and mode; do not present a plan or target as a measured result until a run has produced evidence.
