

Phase 6 Project Testing

FitBuddy AI Fitness Plan Generator

This phase defines how FitBuddy's behavior should be checked before presentation. The provided project folder includes application and setup files but no test folder or recorded test results, so these documents specify checks and evidence to collect rather than reporting completed pass/fail results.

Verification focus

Review the complete user journey: validate a profile, generate and inspect a seven-day plan, save and retrieve it, submit feedback, and confirm the revised result. Also check demo and live AI modes, administrator access, privacy handling and safety language.

Verification matrix

Area	Check	Expected evidence
Input validation	Submit valid, blank and out-of-range profile or feedback values.	Valid data proceeds; invalid data receives a clear response.
Plan content	Generate a plan using a beginner profile and home or bodyweight equipment.	Seven days appear with suitable movements, recovery details and safety guidance.
Persistence	Create a plan, then retrieve it through the supported page or API.	The saved profile and plan match the generated result.
Revision	Submit feedback asking for shorter or easier sessions.	The updated result is visible and the original remains identifiable.
Demo and live mode	Run the selected demo configuration; check live mode separately if used.	The generation source is visible and provider errors are understandable.
Administrator view	Open the protected view without and with valid credentials.	Unauthenticated access is rejected; valid local credentials permit access.

Manual review checklist

- Check the page at desktop and narrow-screen widths; confirm forms and results remain readable.
- Review a plan for equipment fit, weekly balance, recovery and clear exercise language.
- Submit feedback and confirm the revision reflects the request without losing safety guidance.
- Confirm no API key or private profile data appears in pages, logs or shared files.
- Use fictional sample data during the demonstration.

Release gate

Before submission or demonstration, run the project's existing automated suite and complete the manual checklist in the intended environment. Record the date, configuration mode, result and any known issue in the test record. This document describes verification scope and does not substitute for a recorded test run.

Phase outcome

A release is ready to demonstrate when the core flow is repeatable, plan structure and recovery are clear, saved data can be retrieved, feedback is reflected and the local setup is understood.
