

Test Strategy and Cases

FitBuddy AI Fitness Plan Generator

A test plan for the supplied FitBuddy project.

Current test-material status

The provided project folder has no tests directory, test file or recorded test report, and requirements.txt does not include a test runner. The cases below are proposed checks; no pass/fail result is claimed.

Functional test cases

ID	Test	Expected result
T1	Submit a valid profile through the browser form.	A result page shows a seven-day plan, a tip and the mode label.
T2	Submit missing or out-of-range values.	The app returns a clear validation response and does not save an invalid profile.
T3	Generate a plan twice for the same user ID.	Profile values update; plan history keeps separate generated records.
T4	Retrieve a known user ID through the API.	The response contains that user's saved plan history.
T5	Submit feedback for a saved plan.	The latest plan changes, feedback is stored and the original remains available.
T6	Submit feedback for a missing user ID.	The application returns not found without creating an unrelated record.
T7	Open admin routes without and with a valid token.	Unauthenticated requests fail; authorized requests return coach data.
T8	Run with no Gemini key and demo allowed.	A clearly labeled deterministic demo result is available.

Evidence to record

- Code revision and Python version.
- Demo or Gemini mode and relevant model configuration, without recording secret values.
- Test inputs using fictional profile data, expected behavior and observed outcome.
- Screenshots or logs with tokens, keys and personal data removed.

Add automated tests and a test dependency file before reporting suite results. Run the checks in a clean virtual environment before submission.
