

Phase 7 Project Documentation

FitBuddy AI Fitness Plan Generator

This phase gives a new reader the information needed to set up and operate FitBuddy locally. The project README remains the source for commands specific to the selected code snapshot; this document summarizes the shared setup, user flow, system components and operating limits.

Project at a glance

Area	Description
Purpose	Generate a goal-based seven-day workout plan, provide a general nutrition or recovery tip, save results and accept feedback for revisions.
Application	Python and FastAPI, with browser pages rendered from Jinja templates and JSON endpoints.
AI	Optional Gemini generation plus a built-in local or demo path, controlled by environment settings.
Storage	SQLite accessed through SQLAlchemy; local tables are created during startup where configured.
Run environment	Python 3.11 or newer is recommended by the project README; Visual Studio Code is supported.

Local setup

- 1 Open the FitBuddy project folder in Visual Studio Code or a terminal.
- 2 Create and activate a Python virtual environment, then install packages from requirements.txt.
- 3 Copy .env.example to a private .env file. Set a private administrator password and add a Gemini key only if live generation is needed.
- 4 Select the demo or live AI mode supported by the project configuration and start the application using its README or launch profile.
- 5 Open the local application address. Use the API documentation page to inspect available JSON requests.

Main user flow

- Enter a profile and fitness goal, then generate a plan.
- Review the week, wellness tip, safety note and generation mode.
- Submit feedback on the saved plan and review the updated result.
- Retrieve saved records through the application or protected administrator view where enabled.

Configuration and data handling

Keep .env and local database records private. Do not commit API keys, administrator credentials or real user health information to a public repository. Use fictional data when sharing screenshots or recording a demonstration. The application is intended for local use; public deployment needs production authentication, HTTPS, secret management, privacy controls and operational monitoring.

Known product limits

- FitBuddy provides general fitness and wellness information; it is not a medical, rehabilitation or diet-treatment service.
- AI availability, model names and generated content depend on configuration and provider access.
- The local application and sample admin setup are not production hosting or a clinical record system.

Phase outcome

A reader can understand the system, prepare a local environment and follow the main user journey while keeping credentials and personal data private.
