

Setup and User Guide

FitBuddy AI Fitness Plan Generator

Safe local setup and the primary FitBuddy user flow.

Requirements

Use Python 3.10 or newer; the README recommends Python 3.11 or 3.12. Visual Studio Code is supported. A Gemini API key is optional when local demo generation is enabled.

Windows PowerShell setup

```
python -m venv .venv
.\.venv\Scripts\Activate.ps1
python -m pip install --upgrade pip
pip install -r requirements.txt
Copy-Item .env.example .env
```

Configure and start

- 1 Edit the private .env file. Keep GEMINI_API_KEY private; set ADMIN_TOKEN to a private local value.
- 2 For a repeatable no-key demo, keep ALLOW_DEMO_AI=true as described in the README.
- 3 From the project folder, start with: `uvicorn app.main:app --reload`.
- 4 Open `http://127.0.0.1:8000`; use /docs for the interactive API reference and /api/health for service status.

Use the app

- Create a profile with a name, reusable user ID, age, weight, goal and intensity.
- Review the plan, recovery tip and mode label.
- Enter feedback on the result page using the same user ID.
- Use the coach dashboard only with a private token and keep the server local.

The SQLite database is created in the project folder on first run. Before sharing the project, remove or anonymize stored records and verify that .env is not included.
