

Demonstration Plan

FitBuddy AI Fitness Plan Generator

A clear presentation sequence using fictional profile data.

Before presenting

- Start the app on 127.0.0.1 and confirm the home and health pages respond.
- Use a fictional profile such as Alex Demo, ID demo_01, age 28, weight 70 kg, general wellness and medium intensity.
- Use the deterministic demo mode for a repeatable flow, or verify Gemini access before a live run.
- Close the coach dashboard and remove any real token from browser history or the recording.

Walkthrough script

Step	Presenter action	Evidence to highlight
1	Introduce the goal and local-only scope.	A general fitness planner, not a clinical service.
2	Submit the profile.	Validation and the chosen goal/intensity.
3	Review the plan and tip.	Seven days, recovery notes, safety language and mode label.
4	Submit practical feedback.	A confirmation banner and updated plan.
5	Open /docs or the history route.	The JSON interface and saved records.
6	Close with limitations and next steps.	Privacy, evaluation and deployment safeguards.

Presentation checks

- Use the same user ID throughout the feedback flow.
- Do not show .env, the raw database, API keys, admin token or personal records.
- If Gemini is unavailable, switch to the documented demo path and identify it clearly.
- State that generated guidance is general and users should stop for concerning symptoms.

Follow-up

Capture reviewer questions and classify them as usability, safety, privacy, reliability or future-scope work. Do not claim clinical effectiveness or production readiness from a local demo.
