

Phase 8 Project Demonstration

FitBuddy AI Fitness Plan Generator

This phase turns FitBuddy's implemented workflow into a repeatable demonstration. The presentation shows how a user moves from a sample profile to a saved seven-day plan, then requests a revision and reviews the updated result.

Demo preparation

- Start the application locally and confirm the expected home or health page responds.
- Use a fictional sample profile, such as an adult beginner with a general strength goal, moderate effort and home equipment.
- Choose the configured demo mode for repeatability, or verify Gemini access before live generation.
- Keep API keys, administrator credentials and personal records out of recordings and shared files.

Walkthrough

Step	Action	What to show
1	Introduce the problem and scope.	A local assistant for goal-based weekly exercise planning; general guidance only.
2	Enter the sample profile and submit it.	Available profile fields and clear validation behavior.
3	Review the generated result.	Seven days, exercise or warm-up details, recovery, safety note and separate wellness tip.
4	Point out the mode and saved result.	Demo or Gemini source label and confirmation that the plan can be revisited.
5	Submit feedback, such as asking for an easier or shorter week.	The revised plan and confirmation that the request changed the saved result.
6	Show one supporting project view.	Local API documentation or protected administrator page, if included in the setup.

Demonstration success criteria

- The app completes the profile-to-plan flow without exposing private configuration.
- The result is a readable seven-day plan that reflects sample equipment and experience.
- Recovery and safety guidance are visible, and the separate tip remains general.
- The saved plan is retrievable and feedback produces a clear updated result.
- The presenter states the local-demo and non-medical boundaries.

Limits and next steps

A successful prototype demonstration does not establish clinical accuracy, production security or suitability for every user. Sensible next steps include usability review, accessibility improvements, systematic AI-output evaluation, clearer consent and data-retention controls, and a separate security review before any hosted release.

Phase outcome

The demonstration presents FitBuddy's core value in a concrete sequence and gives reviewers evidence of the interface, plan generation, local persistence and feedback loop.
